`var someFunction = function(arg) { if(true) { // do something someFunction('blah'); } }; someFunction('blah');` ... is it possible to get someFunction to refer to itself rather than having to call it again? Thanks in advance for any help! A: No, not in ECMAScript 3. (With regard to ECMAScript 2, the answer is different.) SomeFunction('blah'); will always run someFunction, even if someFunction is defined to have no side-effects. Therefore, someFunction will be evaluated at that time. There is no way to prevent this. SomeFunction is a function that takes one argument, which you have named arg. It performs a given action based on the value of arg. Therefore, someFunction is an invokable function that performs an action based on the value of arg. I have tried to connect to the internet using my home wifi, but I couldn't. The problem is that the wifi icon is not shown, but it is working fine. I checked wifi controller settings, but all is working fine. What might be the problem? A: I had the same problem. In my case a manual restart solved the problem. So go to your menu bar (top menu bar) and press Option (see image). In case you didn't notice it, Option is a key with a grey over it, which is next to the letter P. Press it after you login.
