The recommended range for projection distance (a) is 2.76 to 14.57 inches (7 to 37 cm). 2.55 in. (65Å .Q: Matching Parent & Grandparent objects in backbone My Problem Let's say I have the following model: var Foo = Backbone.Model.extend({ //some properties }); In my Views, I have the following: var DefaultView = Backbone.View.extend({ model: Foo }); DefaultView = Backbone.View.extend({ //default template, render etc... }); //...some more views and views subclasses... I would like to access the parent's model when dealing with the subview. Is there a good way to do this? Hope someone can help me out of this situation Update I would like to have a separate model for the main model and have a one-to-one relationship between the main model and the subview. The subview depends on the main model. Update 2 I have reached the point where I am using the `_.extend()` API but it seems to be an anti-pattern `_.extend(subviewModel, model)`; I would like the code to be as extensible as possible and the maintainability and flexibility to put my own rules for inheritance into place. A: You will likely want to use a prototype based inheritance pattern. For example:
